The Record

A digital publication is so because of the medium in which it is embedded: the computer.

But this is deceptive. Seen exclusively in terms of hardware, the difference between a digital and a paper edition amounts to little more than the difference between a scroll and a codex, or between a book and a microfilm, or even between a softcover and a hardcover book.

The conceptual dimension is more important. A digital publication proper is articulated along very different lines than those we associate with a "book" – regardless of whether the latter is on paper, film or a CD.

The present section includes only that portion of our publications that are "born digital" in the full sense of the word. I call this the Record.

The Record is the pivotal documentary data base around which all the remaining information about Urkesh revolves.

The Urkesh Global Record embraces fully the multi-dimensional characteristics of electronic data processing. It is so vast in scope that it represents properly a parallel "site": while it is conceptually embedded in the Urkesh website, each of its major components is invoked as a discrete site on its own.

The individual books that constitute the Record and are currently completed

------------------------------	-----------	--------------------	--

Recovery/Assignment

C1Daily	2005-8-24	jW	The surveyor laid out and measured the locus, a 2m by 2m square in the far south edge of k12 . We began removing the bakhia terrace, f50 , then a softer, brown fill underneath, f57 . [Input file: P824JW2.J]
	2005-8-25	jW	During the first pick run of the day in accumulation, f57 , encountered another sloping layer of bakhia, similar to f50 . Designated it f58 , and began carefully following it from the N, down toward the monumental wall, f11 . [Inputfile: P825JW.J]
	2005-8-27	jW	We continued to excavate the accumulation, f57 , under the layer of bakhia, f50 , which forms the ancient top of the terrace. Near the end of the day we encountered another layer of bakhia, f58 , under f57 . [Input file: P827JW.J]
	2005-8-28	jW	Excavated the last portion of the bakhia packing, f58 . Below, we found a brown layer of fill containing ash (most in the NE corner) and deteriorated brick chunks (most

Designation/Count

B10.Definition	2005-8-28	gM	burial [Input file: P904GMLJ]
B11.TxtDescr	2005-8-28	rE	Human remains consisting of a well preserved skeleton, buried in the flex position with the head and knees facing north. The head was beside a stack of partially baked bricks, f62 , to the east, while the hips were to the west. More complete exposure of the human remains reveals that the individual was a mature adult. The sciatic notch is medium to wide, but the skull is large and relatively robust. One well-worn incisor, retrieved from the matrix surrounding the mandible, suggests that the individual was at least middle-aged, if not older. [Input file: Q302JW1.J]

<p>9NTypol 2019-1-4- IR</p>	<p>Conclusion: Skeletal analysis estimates J3.8 as a petite female aged 28-35 years at time of death with little tooth wear and several areas of skeletal stress and trauma. The pubis shows pitting and an indentation possibly from pelvic trauma associated with strain. The cervical vertebrae (neck) show osteoarthritis particularly on the anterior inferior surface with evidence of herniated disk cartilage on one thoracic vertebra (presence of Schmorl's nodes). In the lumbar region, one vertebra shows possible trauma to the right side of the spine (anterior) that compressed the vertebra (photo taken). Skeletal stress was also noted on the right hand where the thumb metacarpel articulates with the wrist and the left wrist. This coincides with muscle use of the right forearm that suggests activities involving the wrist and forearm. The left foot also shows stress in the form of frequent foot use that caused cartilage around the navicular to degenerate causing bone friction and eburnation. Comparing this skeleton with later Khabur A16.31, also a female aged 26-35 shows that A16.31 also contains osteophytosis of the neck but not as severe as J3.8 while no other bones showed osteoarthritic changes. Two skeletons from an earlier time period, tentatively dated as Early Dynastic in area F2 show a high degree of premature osteoarthritis of the joint surfaces on young individuals aged between 16-26 years and suggests that occupational stress was responsible. Notes/Future work: Photographs were taken of the skull with the intention of showing them to a paleopathologist in New York. The fracture lines are irregular and appear naturally as a reaction to the skull crushing in postmortem but should be checked by a specialist. [Input file: R425JW.J]</p>

gB outline.txt P904GM.j Draft Talk.txt Q302JW1.j

```
1 |.bk J03
2 |.fl Q302jw1.j
3 |.fd Feature descriptions for J03 features (f31-f60)
4 |.fn Edited by jW on Q302, Q414, and Q415
5 |.ei jw
6 |.ed Q302
7 |.rd P810
8 |.ri rE
9
10 |f 31
11 |ds Natural accumulation in k12, under accumulation f2.
12
13 |f 32
14 |ds Bakhia in the vicinity of f11 wall stones along the west baulk of k101. It was discovered in the process of exploring for the location of the south face
15 |of f11.
16
17 |.rd P813
18 |.rd jW
19
20 |f 33
21 |ds Laminations with small pockets of ash and inclusions of bricky and plaster chunks in k12. Ashy material was 10YR4/2, dark grayish brown, plaster chunks
22 |were 7.5YR7/6, reddish yellow. Lamination color was 10YR5/6, yellowish brown. Bricky chunks were 7.5YR6/6, reddish yellow. Although inclusions were
23 |scattered throughout, they were more concentrated in the NE corner, nearest to the BA temple. Discussions with faB indicated that the temple had been
24 |destroyed at one point in time, which may account for the presence of the inclusions.
25
26 |f 34
27 |ds Broad area of hard-packed fill, below accumulation f33, throughout locus k12. This signaled an abrupt change from the previous accumulation, which was
28 |relatively soft, brown soil with pockets of laminations, bricky material and ash. Originally we thought f34 consisted of laminations formed when soil
29 |washed down from the temple mound and was contained by the massive wall, f11, just to the south and the top of which we are just beginning to uncover. As
30 |seen in section in the north and west baulks after excavation, it appears more likely that this feature was the top layer of packed fill that was part of
31 |the original construction of the temple mound. (Fill, f34, was originally covered by a layer of bakhia, f83, which, except for a small segment seen in the
32 |west baulk, has subsequently been eroded away) This identification as packed fill better accounts for the the abrupt change in density.
33
34 |.rd P814
35
36 |f 35
37 |ds Large "T" shaped limestone block in the middle of the west baulk line of k12. It is unclear whether this is a floating stone or part of a late addition
38 |to the f10, f11 monumental wall complex.

G1Aggregate	2007-1-25	!!	a1 [Input file: A-CUMUL.J]
-----------------------------	-----------	--------------------	--

Deposition

H99.NDepostn	2005-8-29	jW	<p>faB suggested that some of the characteristics of the body (bones darkened but not charred) and its manner of burial (flexed position in a marked grave) could be explained by the following: He hypothesized that the BA temple burned in early Akkadian times. Possibly one or more people were trapped in the ruins and suffocated. Their bodies were heated in the fire to a temperature less than 300 degrees, which darkened the bones. During the process of cleaning the site the ashes and burned bricks were thrown onto the terrace to serve as fill for a new layer of bakhia. When the body was discovered it was buried in the usual manner for the time which must have been in the ash with grave goods and a simple marker of stacked burned bricks. [Input file: P829JW.J]</p>
--------------	-----------	--------------------	---
