Three variations of teh "contact" criterion"

1. direct
2. indirect (e. g., floors on either side of a wall)
3. inferential (e. g., across loci separated by baulks)

- strata may also have a name or definition (e. g., subdivision within s4 for different floor surfaces); these definitions use extra-referential criteria
- a pit is defined by a cut, and if it is not seen at first,m it may be inferred, e. g. f15 is a pit seen only in s5, but it belongs inferentially to s4
-
